Conclusions

Surface reconstruction

- ▶ The surface reconstruction problem consists in the search of the surface that best describes a given set of points.

Surface reconstruction

- ▶ The surface reconstruction problem consists in the search of the surface that best describes a given set of points.

- ▶ In computational intelligence field:
 - ▶ surface reconstruction → function approximation / regression
 - ▶ point cloud → examples
 - ▶ surface → generalization

3D reconstruction pipeline

Several features characterize the reconstruction problem:

- ▶ the inherent structure of the data (e.g., contour) can be easily incorporated in the model;
- ▶ the topology of the surface should be known a-priori or can be obtained from enough dense data;
- ▶ the class of the object: model-based reconstruction.

The Hierarchical SVR model

Conclusions

Self-Organizing Maps

- ▶ SOMs provide a smooth mapping of similar examples.
- ▶ The topological structure can be used as mesh for surface representation.
- ▶ Particular attention has to be paid to the problem of distributing the SOM units on the boundary of the training set.

Self-Organizing Maps (2)

- ▶ Dense SOM can generate unrealistic meshes.
- ▶ Pruning and iterative adaptation provide better results:
 - ▶ removing of unstable vertices;
 - ▶ subdivision of large triangles and refinement.

Self-Organizing Maps (3)

- ▶ Ruled surfaces are commonly used in CAD.
- ▶ Each 3D points line is transformed in a 6-dimensional point that describes the line;
- ▶ in that 6D space, the SOM is trained;
- ▶ the backward transformation allows to obtain the ordered set of lines that defines the surface.

FOSART

- ▶ Clustering provides filtering through local averaging.
- ▶ Topology preserving algorithms limits the averaging only on similar points.
- ▶ Fully self-organizing simplified adaptive resonance theory (FOSART) has been used for filtering a dense 3D point cloud affected by noise.

Enhanced Vector Quantization

- ▶ Extension of the Neural-Gas model:
 - ▶ optimized for low dimensionality spaces;
 - ▶ linear scaling and parallelizable.

Fuzzy k-means

- ▶ Use of computational intelligence techniques as intermediate step.
- ▶ Segmentation of normals of the surfaces points through fuzzy k-means clustering;
- ▶ description of the surface as a collection of planar patches.

Evolutionary

- ▶ Evolutionary optimization for triangle mesh.

Evolutionary

- ▶ Evolutionary optimization for triangle mesh.

Evolutionary

- ▶ Evolutionary optimization for triangle mesh.

Evolutionary

- ▶ Evolutionary optimization for triangle mesh.
- ▶ Linear or quadratic patch segmentation of range data.

Evolutionary

- ▶ Evolutionary optimization for triangle mesh.
- ▶ Linear or quadratic patch segmentation of range data.
- ▶ Artificial immune system for B-spline knot positioning.

Evolutionary

- ▶ Evolutionary optimization for triangle mesh.
- ▶ Linear or quadratic patch segmentation of range data.
- ▶ Artificial immune system for B-spline knot positioning.
- ▶ B-spline surface reconstruction.

- ▶ B-spline surface reconstruction.

- ▶ Evolutionary optimization for triangle mesh.
- ▶ Linear or quadratic patch segmentation of range data.
- ▶ Artificial immune system for B-spline knot positioning.
- ▶ B-spline surface reconstruction.

Neural networks based 3D recovery

- ▶ A feed-forward neural network is fed with the pixel intensities of three images to predict the normal of the depicted surface.
- ▶ From the normals, the surface can be obtained.

Neural networks based 3D recovery (2)

- ▶ A face image is segmented in face parts.
- ▶ A neural network is trained to learn the 3D shape PCA weights from the intensity PCA weights.
- ▶ The 3D shape of the parts is then blended to obtain the 3D shape of the face.

Fuzzy smoothing

- ▶ Post-reconstruction processing.
- ▶ Fuzzy filtering of patches normals.

Fuzzy smoothing

- ▶ Post-reconstruction processing.
- ▶ Fuzzy filtering of patches normals.

The Hierarchical SVR model

Conclusions

The Regression Problem

- ▶ $S = \{(x_1, z_1), \dots, (x_n, z_n)\}$, $x_i \in \mathbb{R}^D$, $1 \leq i \leq n$
 - ▶ data affected by noise

The Regression Problem

- ▶ $S = \{(x_1, z_1), \dots, (x_n, z_n)\}$, $x_i \in \mathbb{R}^D$, $1 \leq i \leq n$
 - ▶ data affected by noise
- ▶ $\hat{f} : \mathbb{R}^D \rightarrow \mathbb{R}$ such that $\hat{f}(x) \approx z = f(x) + \epsilon$ where ϵ is a r.v. with zero mean and finite standard deviation

The Regression Problem (2)

- ▶ The solution \hat{f} has to be chosen in order to minimize a given training error function, L :

- ▶
$$L = \sum_{i=1}^n E(\hat{f}(x_i), z_i)$$

Solution by means of basis functions

Conclusions

Neural-based techniques for regression

- ▶ Generalization ability
 - ▶ Noise filtering effect
- ▶ Non-linear model
- ▶ Small number of hyperparameters
- ▶ Good trade-off between accuracy and computational efficiency
- ▶ Smooth solutions
- ▶ Online learning

Hierarchical approaches

Conclusions

The HRBF Model

- ▶ Input data set: $\{(x_i, z_i) \mid z_i = f(x_i) + \epsilon, x_i \in \mathbb{R}^D, 1 \leq i \leq N\}$

The HRBF Model

- ▶ Input data set: $\{(x_i, z_i) \mid z_i = f(x_i) + \epsilon, x_i \in \mathbb{R}^D, 1 \leq i \leq N\}$
- ▶ HRBF output: $\hat{f}(x) = \sum_{l=1}^L a_l(x; \sigma_l)$
 - ▶ stack of hierarchical layers, at a decreasing scale
 - ▶ σ_l determines the scale of the l -th layer, with $\sigma_l > \sigma_{l+1}$

The HRBF Model

- ▶ Input data set: $\{(x_i, z_i) \mid z_i = f(x_i) + \epsilon, x_i \in \mathbb{R}^D, 1 \leq i \leq N\}$
- ▶ HRBF output: $\hat{f}(x) = \sum_{l=1}^L a_l(x; \sigma_l)$
 - ▶ stack of hierarchical layers, at a decreasing scale
 - ▶ σ_l determines the scale of the l -th layer, with $\sigma_l > \sigma_{l+1}$
- ▶ The network units are equally spaced, $\Delta\mu_l \propto \sigma_l$

layer l

layer $l + 1$

layer $l + 2$

Configuration of the parameters

- ▶ The weights $\{w_{l,k}\}$ are set proportional to the manifold height in the grid crossings: $w_{l,k} = f(\mu_{l,k}) \cdot \Delta\mu_l^D$

Configuration of the parameters

- ▶ The weights $\{w_{l,k}\}$ are set proportional to the manifold height in the grid crossings: $w_{l,k} = f(\mu_{l,k}) \cdot \Delta\mu_l^D$
- ▶ Estimation of $f(\mu_{l,k})$ is carried out considering the points that lie in a neighborhood of $\mu_{l,k}$ called *receptive fields* ($A(\mu_{l,k})$)

Configuration of the parameters

- ▶ The weights $\{w_{l,k}\}$ are set proportional to the manifold height in the grid crossings: $w_{l,k} = f(\mu_{l,k}) \cdot \Delta\mu_l^D$
- ▶ Estimation of $f(\mu_{l,k})$ is carried out considering the points that lie in a neighborhood of $\mu_{l,k}$ called *receptive fields* ($A(\mu_{l,k})$)

$$f(\mu_{l,k}) = \frac{\sum_{x_m \in A(\mu_{l,k})} z_m e^{-\frac{\|\mu_{l,k} - x_m\|^2}{\sigma_l^2}}}{\sum_{x_m \in A(\mu_{l,k})} e^{-\frac{\|\mu_{l,k} - x_m\|^2}{\sigma_l^2}}}$$

Multi-scale reconstruction

Choosing σ small enough, a single layer will be able to reconstruct the finest details, but:

Multi-scale reconstruction

Choosing σ small enough, a single layer will be able to reconstruct the finest details, but:

- ▶ wasted units in those regions which feature large scale details

Multi-scale reconstruction

Choosing σ small enough, a single layer will be able to reconstruct the finest details, but:

- ▶ wasted units in those regions which feature large scale details
- ▶ lack of points inside $A(\mu_{l,k})$ for a reliable weight estimate

Multi-scale reconstruction

Choosing σ small enough, a single layer will be able to reconstruct the finest details, but:

- ▶ wasted units in those regions which feature large scale details
- ▶ lack of points inside $A(\mu_{l,k})$ for a reliable weight estimate

Coarse-to-fine multi-scale approximation: the first layer reconstructs the large scale details, while the next layers reconstruct the residuals:

- ▶ $r_l(x_m) = r_{l-1}(x_m) - a_l(x_m)$, where $r_0(x_m) = z_m$

Multi-scale reconstruction

Choosing σ small enough, a single layer will be able to reconstruct the finest details, but:

- ▶ wasted units in those regions which feature large scale details
- ▶ lack of points inside $A(\mu_{l,k})$ for a reliable weight estimate

Coarse-to-fine multi-scale approximation: the first layer reconstructs the large scale details, while the next layers reconstruct the residuals:

- ▶ $r_l(x_m) = r_{l-1}(x_m) - a_l(x_m)$, where $r_0(x_m) = z_m$

Each new layer features half the scale of the previous one:

- ▶ $\sigma_l = \sigma_{l-1}/2$

Sparse approximation

The Gaussians of a new layer are inserted only where a poor approximation is obtained from the previous layers.

Sparse approximation

The Gaussians of a new layer are inserted only where a poor approximation is obtained from the previous layers.

- ▶ The *local residual error*, $R(\mu_{l,k})$ evaluates the quality of the approximation over $A(\mu_{l,k})$:

$$R(\mu_{l,k}) = \frac{\sum_{x_m \in A(\mu_{l,k})} |r_{l-1}(x_m)|}{|A(\mu_{l,k})|}$$

Sparse approximation

The Gaussians of a new layer are inserted only where a poor approximation is obtained from the previous layers.

- ▶ The *local residual error*, $R(\mu_{l,k})$ evaluates the quality of the approximation over $A(\mu_{l,k})$:

$$R(\mu_{l,k}) = \frac{\sum_{x_m \in A(\mu_{l,k})} |r_{l-1}(x_m)|}{|A(\mu_{l,k})|}$$

- ▶ When $R(\mu_{l,k})$ is over a given threshold, ϵ , the Gaussian is inserted.

Layer l

Layer $l + 1$

Layer $l + 2$

Initialization

The only *a priori* information needed is the error threshold ϵ :

Initialization

The only *a priori* information needed is the error threshold ϵ :

- ▶ The scale parameter of the first layer, σ_1 , can be chosen proportional to the maximum side length of the bounding box data

Initialization

The only *a priori* information needed is the error threshold ϵ :

- ▶ The scale parameter of the first layer, σ_1 , can be chosen proportional to the maximum side length of the bounding box data
 - ▶ In this case the center of the Gaussian, $\mu_{1,1}$, will be positioned at the center of the bounding box

Initialization

The only *a priori* information needed is the error threshold ϵ :

- ▶ The scale parameter of the first layer, σ_1 , can be chosen proportional to the maximum side length of the bounding box data
 - ▶ In this case the center of the Gaussian, $\mu_{1,1}$, will be positioned at the center of the bounding box
- ▶ New layers will be inserted until the training error is under threshold on the entire domain

HRBF vs. RBF

RBF (*newrb* matlab function)

conf time: 776.37 s

units: 341

err mean: 0.0079

The Hierarchical SVR model

Conclusions

Parameters setup

- ▶ For each HSVR layer, ϵ , C , and σ have to be defined

Parameters setup

- ▶ For each HSVR layer, ϵ , C , and σ have to be defined
- ▶ The value of σ_1 is somehow arbitrary, $\sigma_l = \frac{1}{2}\sigma_{l-1}$
 - ▶ it can be chosen proportional to the size of the input region

Parameters setup

- ▶ For each HSVR layer, ϵ , C , and σ have to be defined
- ▶ The value of σ_1 is somehow arbitrary, $\sigma_l = \frac{1}{2}\sigma_{l-1}$
 - ▶ it can be chosen proportional to the size of the input region
- ▶ The parameter C_l is set proportional to the standard deviation of the residual:

$$C_l \propto \text{std}(r_{l-1}(x_i))$$

Parameters setup

- ▶ For each HSVR layer, ϵ , C , and σ have to be defined
- ▶ The value of σ_1 is somehow arbitrary, $\sigma_l = \frac{1}{2}\sigma_{l-1}$
 - ▶ it can be chosen proportional to the size of the input region
- ▶ The parameter C_l is set proportional to the standard deviation of the residual:

$$C_l \propto \text{std}(r_{l-1}(x_i))$$

- ▶ The only parameter that cannot be estimated from the data set is the parameter ϵ
 - ▶ this should be proportional to the accuracy required for the regression

SVs reduction

- ▶ The drawback of this scheme is the total number of SVs used, that is significantly higher than in standard SVR
 - ▶ large- σ layers have a number of SVs similar to small- σ layers

SVs reduction

- ▶ The drawback of this scheme is the total number of SVs used, that is significantly higher than in standard SVR
 - ▶ large- σ layers have a number of SVs similar to small- σ layers

SVs reduction

- ▶ The drawback of this scheme is the total number of SVs used, that is significantly higher than in standard SVR
 - ▶ large- σ layers have a number of SVs similar to small- σ layers

- ▶ To reduce the SVs number, for each level, the points close to the ϵ -tube's border are selected

SVs reduction

- ▶ The drawback of this scheme is the total number of SVs used, that is significantly higher than in standard SVR
 - ▶ large- σ layers have a number of SVs similar to small- σ layers

- ▶ To reduce the SVs number, for each level, the points close to the ϵ -tube's border are selected

SVs reduction

- ▶ The drawback of this scheme is the total number of SVs used, that is significantly higher than in standard SVR
 - ▶ large- σ layers have a number of SVs similar to small- σ layers

- ▶ To reduce the SVs number, for each level, the points close to the ϵ -tube's border are selected
- ▶ and used as training set for a second step of configuration

SVs reduction

- ▶ The drawback of this scheme is the total number of SVs used, that is significantly higher than in standard SVR
 - ▶ large- σ layers have a number of SVs similar to small- σ layers

- ▶ To reduce the SVs number, for each level, the points close to the ϵ -tube's border are selected
- ▶ and used as training set for a second step of configuration
- ▶ The so obtained SVs are those of the considered layer

SVs reduction

- ▶ The drawback of this scheme is the total number of SVs used, that is significantly higher than in standard SVR
 - ▶ large- σ layers have a number of SVs similar to small- σ layers

- ▶ To reduce the SVs number, for each level, the points close to the ϵ -tube's border are selected
- ▶ and used as training set for a second step of configuration
- ▶ The so obtained SVs are those of the considered layer

- ▶ Due to the hierarchical scheme, the error introduced by the approximation is recovered by the next layers

Results (1)

The training set is a sampling of the function: $\sin(2\pi x^4) + x + u_{[-0.1,0.1]}$

Target function

Results (1)

The training set is a sampling of the function: $\sin(2\pi x^4) + x + u_{[-0.1,0.1]}$

SVR ($\epsilon = 0.05$, $\sigma = 0.0313$, $C = 20$)

Results (1)

The training set is a sampling of the function: $\sin(2\pi x^4) + x + u_{[-0.1,0.1]}$

SVR ($\epsilon = 0.05$, $\sigma = 0.0313$, $C = 20$)

Results (1)

The training set is a sampling of the function: $\sin(2\pi x^4) + x + u_{[-0.1,0.1]}$

SVR ($\epsilon = 0.05, \sigma = 0.0313, C = 20$)

HSVR ($\epsilon = 0.075$)

HSVR with SV reduction ($\epsilon = 0.075$)

	Err_{mean}	$\#SVs$
HSVR	0.0254	1462
HSVR (red.)	0.0228	206
SVR	0.0979	163

Results (2)

Results (2)

- ▶ The error introduced by the reduction step:
 - ▶ is recovered in the next layer
 - ▶ decrease with adding of new layers

HRBF vs. HSVR

HRBF

HSVR

HSVR red.

	Err _{mean}	#SVs (tot.)	Time
Online HRBF	0.0112	14,784	44 s
HSVR	0.0110	100,448	682 s
HSVR (Red)	0.0112	11,351	1,104 s

The Hierarchical SVR model

Conclusions

Conclusions

- ▶ Neural-based methods can be effectively applied to regression problems
- ▶ Hierarchical structures can improve the accuracy of the standard methods providing:
 - ▶ multi-scale solutions
 - ▶ more robustness
 - ▶ simplification in hyperparameters selection

Conclusions (2)

- ▶ HRBF
 - ▶ Fast configuration based on local operations
 - ▶ Few hyperparameters to select
 - ▶ Efficient for problems with few input variables

- ▶ HSVR
 - ▶ More accurate thanks to the use of different kernels
 - ▶ Hyperparameters space reduced wrt the standard SVM
 - ▶ Compact solutions using reduction step

Future directions

▶ HRBF

- ▶ Real-time implementation
 - ▶ technology choice (e.g., CUDA GPU)
 - ▶ new algorithmic constraints
- ▶ Extension to non-regular coverage
 - ▶ incremental learning to recover the residuals
 - ▶ fine-to-coarse iteration
- ▶ Classification
 - ▶ smoothness hypothesis
 - ▶ non-homogeneous input variables

▶ HSVR

- ▶ On-line reformulation
 - ▶ global optimization
 - ▶ memory to store intermediate data
